What is Phishing?

Phishing is a cyber attack where attackers pretend to be trusted organizations to steal:

- Passwords*
- Credit card information*
- Banking details*
- Personal data*

Why Phishing is Dangerous

- Consequences:
- Financial loss
- Identity theft
- Data breaches
- Account compromise
- Malware infection
- **Example:**

- 1.A user receives a fake bank email and enters login details.
- 2.The attacker gains access to the account.

Types of Phishing Attacks

- **Email Phishing**
 - Fake emails.
- **Spear Phishing**
 - Targeted attacks against specific people.
- **Smishing**
 - Phishing through SMS.
- **Vishing**
 - Phishing through phone calls.
- **Clone Phishing**
 - Copies of legitimate emails with malicious links.

How to Recognize Phishing Emails

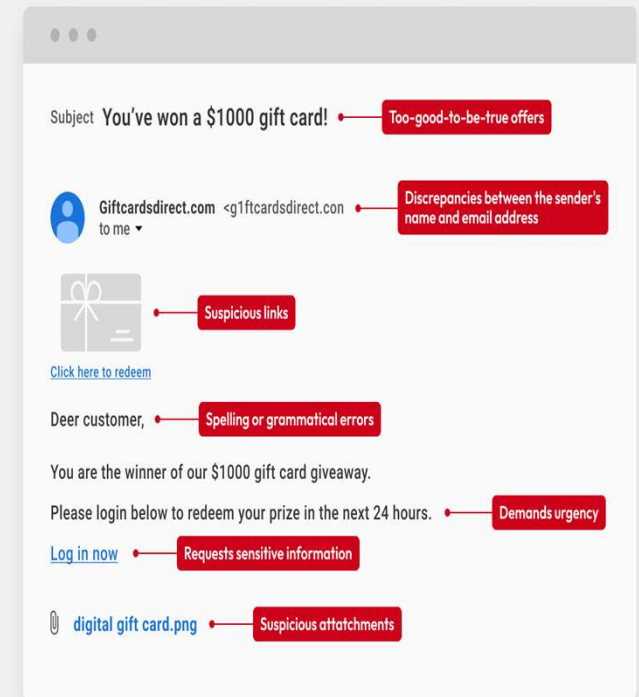

- **Characteristics:**

-  Unknown sender
-  Urgent messages
-  Spelling mistakes
-  Suspicious links
-  Unexpected attachments
-  Requests for passwords

Example:

- Your account will be suspended within 24 hours.
- Click here immediately.

How To Identify a Phishing Email

Example of a Phishing Email

- **Example:**

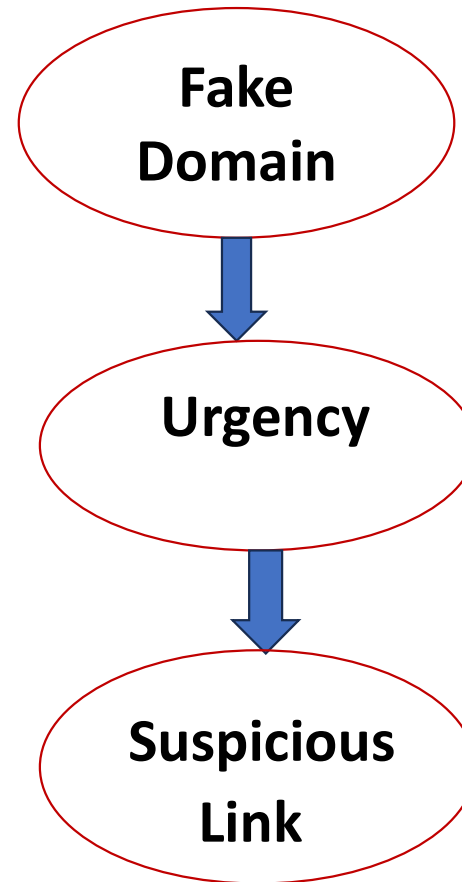

From: support@amaz0n-security.com

Dear Customer,

Your account has been locked.

Please verify your credentials immediately.

Click Here

How to Identify Fake Websites

- **Teach Users to Check:**

- 1.URL spelling**

- Example:**

- Real:

- amazon.com

- Fake:

- amaz0n-security.com

- 2.HTTPS**

- https://

- Security certificate
 - Poor website design
 - Strange popups

Social Engineering Techniques

- **Pretexting**

- Creating fake stories.

Example:

Attacker pretends to be IT support.

- **Baiting**

- Offering free software or rewards.
-

- **Impersonation**

- Pretending to be a manager or bank employee.
-

- **Tailgating**

- Following employees into secure areas.

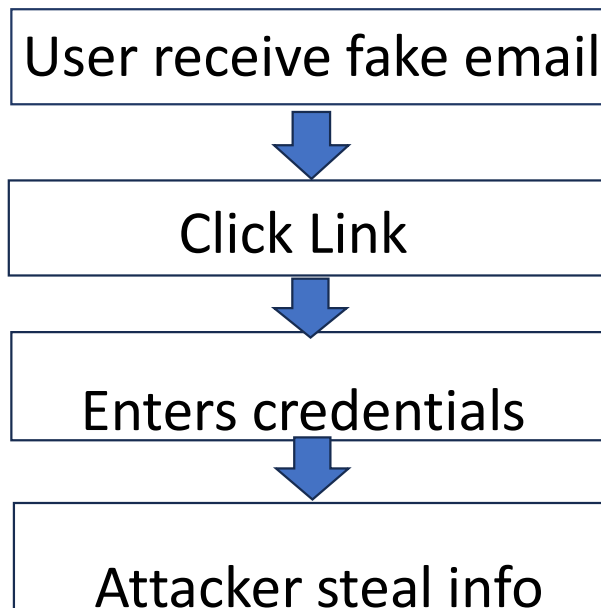

Real World Phishing Example

Example:

- In 2016, phishing emails were used to steal employee credentials and cause significant financial losses in organizations worldwide.

Explain:

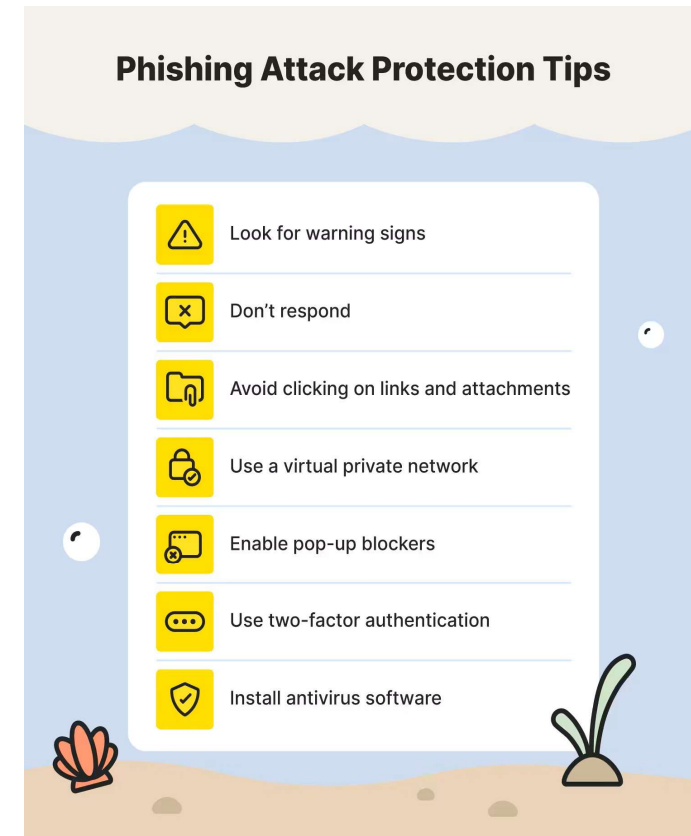

Attack Flow:
